Universidad del Valle de Guatemala Facultad de Ingeniería Departamento de Ciencias de la Computación Diseño de lenguajes de programación

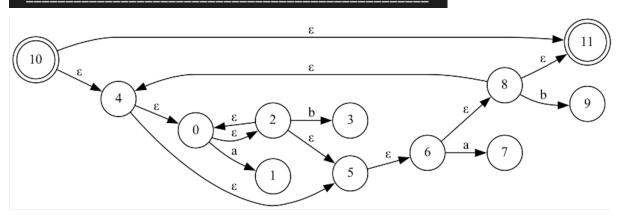

Pre-laboratorio A

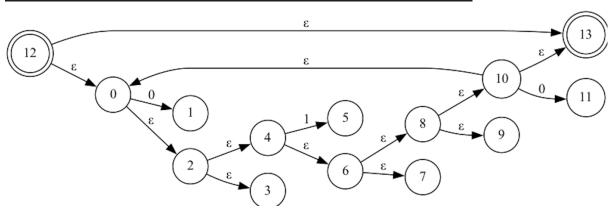

Construya un AFN utilizando el algoritmo de Thompson.

1. ab * ab *

```
Ingrese la expresión regular: ab * ab *
--->La expresión regular ingresada es válida...
 -->La expresión regular se está formateando...
La expresión regular formateada es: a.b.*.a.b.*
--->Convertimos a postfix...
La expresión regular en postfix es: ab.*.a.b.*.
 -->Convertimos de postfix a NFA...
     ===NFA==
Start state: State 10
          Transitions:
          State 10 -- \epsilon --> State 4 State 10 -- \epsilon --> State 11
          State 0 -- a --> State 1
          State 0 -- \epsilon --> State 2
          State 8 -- b --> State 9
          State 8 --- \epsilon ---> State 4
          State 8 -- ε --> State 11
          State 2 -- b --> State 3
          State 2 --- \epsilon ---> State 0
          State 2 -- \epsilon --> State 5
          State 4 -- \epsilon --> State 0
          State 4 --- \epsilon ---> State 5
          State 6 -- a --> State 7
          State 6 -- \epsilon --> State 8
          State 5 --- \epsilon ---> State 6
  -->Convertimos el NFA a un grafo...
```

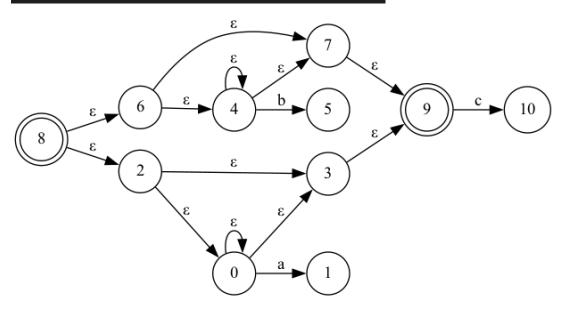

```
Ingrese la expresión regular: 0? (1? )? 0 _*
 -->La expresión regular ingresada es válida...
--->La expresión regular se está formateando...
La expresión regular formateada es: 0.ε.(1.ε).ε.0.*
 --->Convertimos a postfix...
La expresión regular en postfix es: 0ε.1ε..ε.0.*.
 -->Convertimos de postfix a NFA...
======NFA======
Start state: State 12
         Transitions:
         State 8 -- \epsilon --> State 9
         State 8 -- ε --> State 10
         State 4 --- 1 ---> State 5
         State 4 -- \epsilon --> State 6
         State 12 --- \epsilon ---> State 13
         State 12 -- ε --> State 0
         State 10 -- 0 --> State 11
         State 10 -- ε --> State 13
         State 10 -- \epsilon --> State 0
